Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

with AP ma sed alone. roperties, mouthfee	deamidated, in Glu (free and/or peptide bound), in which case products are useful as animal feed additives of an also be used in flavour-improving compositions (optionally containing AP) and in dough pre-mixes also for deactivating enzymes and for converting precursors to mature proteins. DPAP increases the level of hydrolysis of proteins and thus	The present sequence represents dipeptidyl aminopeptidase (DPAP) from Aspergillus oryzae. DPAP acts synergistically with an aminopeptidase (AP) to hydrolyse polypeptides, producing protein hydrolysate (PH), useful in foods as flavour enhancer, e.g. in baked goods, enriched in: (a) Ala, Arg, Asp, Gly and/or Val, or (b), if the substrate has been	N-PSDB; X00070. Claim I; Fig I; 92pp; English.

Coryzae. AP is used in combination with an endopeptidase (EP) to hydrolyse polypeptides, producing protein hydrolysate (PH), useful in the foods as flavour enhancer, e.g. in baked goods, enriched in: (a) Leu, constituted in the substrate has been deamidated, in Glu (free and/or peptide bound), consecuting protein sanimal feed additives. AP can be used in flavour-improving compositions (optionally containing EP) and in converting precursors to mature proteins. AP increases the level of hydrolysis of proteins and thus of flavour development. PH have improved solubility, emulsifying and foaming properties, and products containing them have better flavour, palatability and aroma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Aspergillus oryzae aminopeptidase II.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            В
Claim 4; Fig 1; 84pp; English.

CA method has been developed for the production of protein hydrolysates (PH) comprising reacting a protein with: (1) at least one polypeptide with Gly-releasing activity; and (11) at least one other protease so that the amount of Gly produced is greater than when the protease is used alone. PH are used to improve flavour of foods (e.g. baked goods) and as animal feed additives. PH are preferably also enriched in Glu can alone the protease of compartice with Gly-releasing activity increases the Addition of a polypeptide with Gly-releasing activity increases the degree of hydrolysis (or reduces the amount of enzyme needed) and crust colour. The present sequence represents Aspergillus oryzae aminopeptidase II, which is used in the method of the invention.
                                                                                                                                                                                                                                                                                                         20-OCT-1997; US-062893.

The present sequence represents aminopeptidase (AP) II y from Saccharomycea cerevisiae. AP is used in combination with an endopeptidase (EP) to hydrolyse polypeptides, producing protein hydrolysate (PH), useful in foods as flavour enhancer, e.g. in baked goods, enriched in: (a) Leu, Gly (especially), Glu, Ser, Asp, Asp, Pro, Cys, Ala and/or Gln, or (b), if the substrate has been deamidated, in Glu (free and/or peptide bound), in which case products are useful as animal feed additives. AP can be used in flavour-improving compositions (optionally containing EP)
                                                                                                                                                                                                                                                                           17-MAR-1999 (first_entry)
Saccharomycea cerevistae aminopeptidase II Y.
Aminopeptidase; protein hydrolysate; baking; dough; flavour enhancer;
mouthfeel; palatability; aroma; hydrolysis; animal feed additive.
Saccharomyces cerevisiae.
                                                                                                             hydrolysates enriched in particular a enhancers, e.g. in doughs

Saccharomyces cerevisiae aminopeptidase II Y.
Aminopeptidase; protein hydrolysate; glycine releasing; proteas
proteinaceous material; flavour; food; baking; animal feed addi
palatability; hydrolysis; solubility; emulsifying; foaming; ard
mouthfeel; crust colour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and in dough pre-mixes. Also AP can be used for deactivating enzymes and for converting precursors to mature proteins. AP increases the level of hydrolysis of proteins and thus of flavour development. PH have improved solubility, emulsifying and foaming properties, and products containing them have better flavour, palatability and aroma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                Saccharomyces cerevisiae.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A method has been developed for the production of protein hydrolysates (PH) comprising reacting a protein with; (1) at least one polypeptide with (2) at least one polypeptide with the amount of Gly produced is greater than when the protease so that the amount of Gly produced is greater than when the protease is used alone. PH are used to improve flavour of foods (e.g. baked goods) and as animal feed additives. PH are preferably also enriched in Glu (free and/or peptide bound), so have improved flavour and palatability. Addition of a polypeptide with Gly-releasing activity increases the degree of hydrolysis (or reduces the amount of enzyme needed) and hydrolysates have better solubility, and emulsifying and feaming properties. Baked goods containing them have improved aroma, mouthfeel and crust colour. The present sequence represents Saccharomyces cerevisiae aminopeptidase II y from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

Mycobacterial DNA vectors containing rejidentifying coding or promoter sequence: infection-associated protein expression claim 32; Fig 19F; 309pp; French.

Sequences Y04742-Y05000 and Y07201-Y0720
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     identifying coding or promoter sequences involved in infection-associated protein expression claim 32; Fig 19D; 309p; French.
Sequences Y04742-Y05000 and Y07201-Y07204 represent secreted protei from various Mycobacterium species microorganisms. The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection.
                                                                                                                                                                                                                                          06-JUL-1999 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 from various Mycobacterium species microorganisms. The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection. Sequence 527 AA;

Suggested activities include nutritional activity, immune stimulating (e.g. as vaccines) or suppressing activity, haematopoiesis regulating activity, tissue growth activity, activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, and tumour inhibition activity (no data is given in the specification to support these activities). The polynucleotide is also stated to be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  polynucleotide is

Claim 25; Fig 4; 28pp; English.
This sequence represents residual protease III (rp-III) from Bacillus subtilis, and was decoded from the appropriate DNA as detailed in Q29134. The protease is secreted by B. subtilis in large amounts, and can cause proteolytic degradation of any protein produced by the bacteria, ie. a recombinant product. By introducing mutations in the protease gene heterologous polypeptides can be expressed which do not cause lowered levels of proteolytic damagae. Also RP-III protease can be expressed for use in improving the cleaning activity of laundry powders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        expressed for use in improving the or for use in industrial processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Monoclonal antibody against prostate-specific membrane antigen - pr used for diagnosis and treatment of prostatic cancer Claim 2; Fig 1; 76pp; English.

CC The present sequence represents the prostate-specific membrane antigen CC (PSMA). A novel monoclonal antibody (MAb) has been developed which has CC an antigen-binding region specific for the extracellular domain (ECD) of CC PSMA. The MAb is used for detecting the presence of PSMA (or its new Variant PSM', which lacks the intracellular domain (ICD)) in biological CC specimens or cancer cells, particularly for the diagnosis, prognosis and CC monitoring of prostate cancer; in which levels of PSMA are elevated.

CC Kits for carrying out this method are also included within the scope of CC the invention. The MAb can also be used for treatment of prostatic CC cancer and associated metastases, optionally when conjugated to a drug, CC cancer and associated metastases, optionally when conjugated to a drug, CC effective detection than the known antibody 7EII-CI5 which binds to the CC CC and detects PSMA only in necrotic or appototic cells (and can not CC detect PSM' at all). Tests for PSMA can be done on blood and urine, without the need for a blopsy sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The peptidase is useful in the hydrolysis of peptides high in hydrophobic amino acids, this is useful in food manufacture as such peptides have a bitter taste. The aminopeptidase removes amino acids sequentially from the N-terminus of a peptide at an optimum reaction temperature of 50 deg. C. and a pH of between 8 and 10.

CC antigen (PSMA) which is a type II membrane protein. The extracellular domain of the prostate specific membrane CC antigen (PSMA) which is a type II membrane protein. The extracellular CC domain is modified to construct a new recombinant fusion protein, a CC PSMA immunofusin. The new recombinant DNA construct is used for CC expression and secretion of a target protein, whose sequence is free of immunoglobulin CH1 domain. The construct comprises a polynucleotide CC encoding from its 5′ to 3′ direction a secretion signal sequence, CC comprising a sequence encoding an immunoglobulin Fc region, and a CC sequence encoding the target protein. A replicable expression vector comprising the polynucleotide sequence can be used to transfect a host cell. The products can be used to produce a recombinant fusion protein comprising the Fc region and target protein. The DNA can be expressed at high levels in a host cell, and the fusion protein is efficiently produced and secreted.

The inventors have identified 3 peptides of high hydrophilicity to which antibodies may be directed against. In the specification the specific membrane spanning domain is stated to be grecification the specific membrane spanning domain is stated to be from amino acid residue 19 to residue 44. The PSM coding sequence is useful for suppressing or modulating the metastatic ability of prostate tumour cells to grow, or for eliminating them. The protein attractive target for Ab-directed imaging and targeting of prostatic tumour deposits.

                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                         DNA encoding alternatively spliced prostate-specific membrane antigen - useful to develop prods. for detecting haematogenous micrometastic tumour cells, or prostate cancer progression prostate-specific membrane (PMN) antigen (W02234) is a type II Example 1; Fig 47A-D; 284pp; English.

CP Prostate-specific membrane (PMN) antigen (W02234) is a type II integral membrane gycoprotein that is highly expressed in prostatic tumours and metastases and is almost entirely prostate-specific.

CI it provides an attractive cell surface epitope for antibody-directed diagnostic inaging and cytotoxic targeting modalities. Its amino cardiscented diagnostic inaging and cytotoxic targeting modalities. Its amino cardisequence was deduced from a cDNA clone (T36785) obtd. from human lymph node carcinoma of prostate cells. An alternatively spliced variant of PSM (PSM') lacks the first 57 amino acids of PSM and is probably cytosolic. Detn. of PSM/PSM' tumour index can be used to assess prostate cancer progression; PSM is the dominant form in primary prostatic tumours.
                                                                                                                                                                                                                                                                                                                 Query Match
